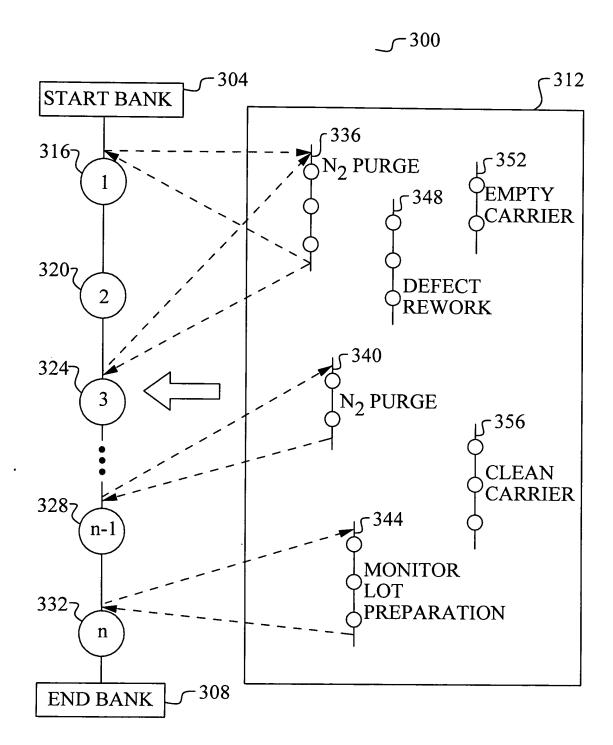

FIG. 5

	ACTIVITY	Input floating process flow	through management unit $\&$ keep on data unit. Unify	flow by recipe unification.	Operation interface receives	external trigger and passes	it to control unit. Trigger	may be operator of system.	Control unit extracts a proper	floating process flow from a data unit.	Connect floating to standard flow.	Control unit triggers a transportation	system to move a lot to equipment	of 1st oper. in floating process flow.	Dispatch and transport system control	lot movement in full automation mode.	When floating flow complete, return	to standard flow. Control unit	destroys connection between flows.
